What is Swish?

An identity based profile for the internet that swish verifies the owner of. We are creating a user network, like a social network, but based around the premise of identity on the internet. Using identity as a stepping stone we will turn our attention towards pushing the boundaries of what is login, internet accounts, and everyday security tools.

Identity Verification

Identity verification is the process of verifying the ownership of a set of identity documents as to be used for identity on the internet. Common methodologies include government issued documents, bank verification, and facial feature comparison. Verification is typically used for secure customer authentication & government compliance

Verification Providers

Swish uses industry best identity verification providers. **We ensure the deletion of any sensitive user data from their platform within (7) days.** We do not maintain complete copies on our platform of sensitive documents such as: driver license, passport, legal documents, or otherwise. We do extract a fragment of data from these documents such as a partial ID number or small section of an image.

What is Online Identity?

Online Identity is a social identity that Internet users establish in online communities and websites. Our goal is to become the enabler of an internet account you can use anywhere privately, but have the ability to share your true identity through.
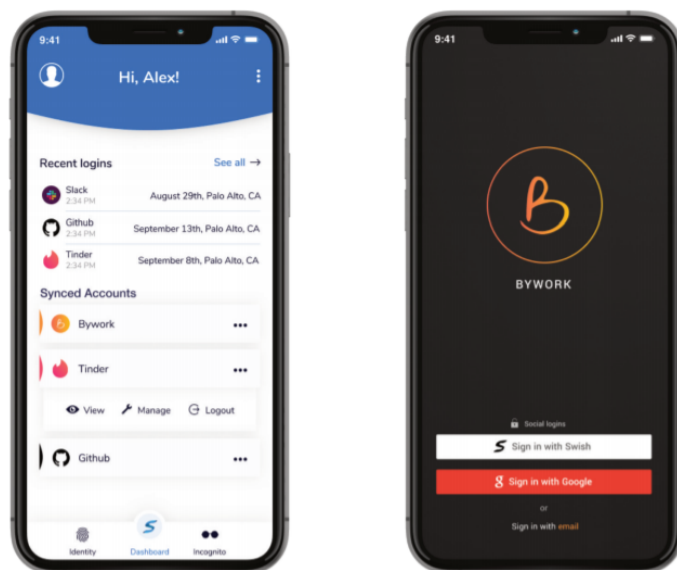

Verified Online Identity

The Identity profile is made up of the information Swish uses to verify the identity of a user. Although the type of information collected is sometimes public, we store only a fragment of the data to ensure legal compliance & diligent verification records.

Swish allows you to download all related account information to ensure openness over your data & privacy. Keep in mind, the data Swish maintains could not be used to create a duplicate verified account.

Future Development

Introducing; Swish Login.

We are building an account system that enables identity but prefers privacy. This allows users to safely transact identity on the internet. With that, we intend to reinvent the login.

Our Philosophy

To build the internet account system that we want to use.

We do not sell your stored data, your account activity, or promote ads.
Eventually, we will charge sites to implement our login portal.

Future Tooling

- **Identity PoS (Point-of-Sale)**

    A handheld device that allows access to Swish Online at any physical location.

- **Consumer Security Tools**

    Clean & usable integration of advanced security features for the everyday user.

- **Corporate Security Tools**

    Clean & usable integration of advanced security features for the everyday employee.

- **Blockchain Development**

    The account infrastructure of blockchain 3.0.

- **Simplified Global Identity Roles**

    A new set of identity role standards for the internet {student, traveler, adult}.
